Infinity is NOT a number and for the most part doesn't behave like a number. However, despite that we'll think of infinity in this section as a really, really, really large number that is so large there isn't another number larger than it. This is not correct of course but may help with the discussion in this section.

The method of regularization using a cutoff function can "smooth" the series to arrive at $\hat{\zeta}(1) = 1/12$. Smoothing is a conceptual bridge between zeta function regularization, with its reliance on complex analysis, and Ramanujan summation, with its shortcut to the Euler-Maclaurin formula. Instead, the method operates directly on conservative transformations of the series, using methods from real ...

T. For example, $\#\{1,2,3\} < \#\{1,2,3,4\}$ since no matter how you map the elements of $\{1,2,3\}$ into the set $\{1,2,3,4\}$, something in the latter set will be left out. 2 Infinite Cardinal Numbers Notice that in our definition of when two sets have the same cardinality, we said nothing about whether they were finite or not.

Infinity is not "getting larger", it is already fully formed. Sometimes people (including me) say it "goes on and on" which sounds like it is growing somehow. But infinity does not do anything, it just is. Infinity is not a real number. Infinity is not a real number, it is an idea. An idea of something without an end. Infinity cannot be measured.

The real numbers are part of a larger family of numbers called the complex numbers. And while the real numbers correspond to all the points along an infinitely long line, the complex numbers correspond to all the points on a plane, containing the real number line. That plane is called the complex plane.
